#### Abstract

The $n$-cube $Q_{n}$ is the graph whose vertex set is the set of all $n$-dimensional Boolean vectors, two vertices being joined if and only if they differ in exactly one coordinate. The $n$-star graph $S_{n}$ is a simple graph whose vertex set is the set of all n! permutations of $\{1,2, \cdots, n\}$ and two vertices $\alpha$ and $\beta$ are adjacent if and only if $\alpha(1) \neq \beta(1)$ and $\alpha(i) \nexists \beta(i)$ for exactly one $i, i \neq 1$.

In this paper we determine weak convex domination number for hypercubes. Also convex, weak convex, $m$ - convex and ll-convex numbers of star and hypercube graphs are determined.

Keywords: Convexity number, Weak convexity number, Weak convex domination, m - convexity number, 11 - convexity number.

Mathematics Subject Classification: 05C12

## Introduction

Graphs considered here are connected, simple. Akers and Krishnamurthy introduced the $n$-star graph $S_{n}$ [1]. The vertex set of Snis the set of all $\mathrm{n} \square$ permutations of $\{1,2, \cdots, \mathrm{n}\}$ and two vertices $\alpha$ and $\beta$ are adjacent if and only if $\alpha(1) \neq \beta(1)$ and $\alpha(i) \neq \beta(i)$ for exactly one $i, i \neq 1$.

The n-star graph is an alternative to n-cube with superior characteristics. Day and Tripathi have compared the topological properties of the $n$-star and the n-cube in [5]. Arumugam and Kala have determined some domination parameters of star graph and obtained bounds for $\gamma, \gamma_{\mathrm{i}}, \gamma_{\mathrm{t}}, \gamma \mathrm{c}$ and $\gamma_{\mathrm{p}}$ in n -cube for $\mathrm{n} \geq 7$ in [2].

Let $G$ be a simple connected graph. A subset $S$ of $V$ is called a convex set if for any $u$, $v$ in $S, S$ contains all the vertices of every $u$ -v geodesic in G . A subset S of V is called a weak convex set if for any $u$, $v$ in $S, S$ contains all the vertices of $a u-v$ geodesic in $G$.

A subset $S$ of $V$ is called a $m$ - convex set if for any $u$, $v$ in $S, S$ contains all the vertices of every $u-v$ induced path in $G$.

A subset S of V is called all - convex set if it is convex and has a vertex which is adjacent to rest of the vertices of $S$. Maximum
cardinality of a proper convex set is the convexity number of $G$. In a similar way we define weak convex number, $m$ - convex number and $l_{1}$ - convex is the maximum of $\{C o n<N[x]>/ x \varepsilon V(G)\}$.

A subset S of V is called a domination set if every vertex in $\mathrm{V}-\mathrm{S}$ is adjacent to at least one vertex in $S$. A dominating set is a weak convex dominating set if it is weak convex. So far exact value of domination number for large $n$ in $Q_{n}$ has not been determined. Here we determine weak convex domination number of $Q_{n}$ for any $n$.

## Results on Convexity Number Parameters

For $Q_{n}$
$\operatorname{Con}\left(\mathrm{Q}_{\mathrm{n}}\right)=2^{\mathrm{n}-1}$ for all n .
$\operatorname{wcon}\left(Q_{n}\right)=2^{n-1}$ for all $n$.
$1_{1}-\operatorname{con}\left(\mathrm{Q}_{\mathrm{n}}\right)=2$ for all n .
$\operatorname{mcon}\left(\mathrm{Q}_{\mathrm{n}}\right)=2^{\mathrm{n}-1}$ for all n .
For $S_{n}$
$\operatorname{Con}\left(\mathrm{S}_{3}\right)=3$.
$w \operatorname{con}\left(S_{3}\right)=4$.
$\operatorname{mcon}\left(\mathrm{S}_{3}\right)=2$
$1_{1}-\operatorname{con}\left(\mathrm{S}_{3}\right)=2$.
$\operatorname{Con}\left(\mathrm{S}_{4}\right)=6$.
$\operatorname{wcon}\left(\mathrm{S}_{4}\right)=18$.
$\operatorname{mcon}\left(\mathrm{S}_{4}\right)=6$
$1_{1}-\operatorname{con}\left(\mathrm{S}_{4}\right)=3$.
In general
$\operatorname{Con}\left(\mathrm{S}_{\mathrm{n}}\right)=6$ for all n .
$\operatorname{wcon}\left(\mathrm{S}_{\mathrm{n}}\right)=2 \mathrm{n}$ for all n .
$\operatorname{mcon}\left(\mathrm{S}_{\mathrm{n}}\right)=6$ for all n
$1_{1}-\operatorname{con}\left(S_{n}\right)=n$ for all $n$, since girth of $S_{n}$ is $C_{6}$ and circumference of $S_{n}$ is $C_{2 n} . S_{n}$ is $n-1$ regular.

## Main Results

Weak convex domination number in $\mathrm{Q}_{\mathrm{n}}$
Theorem $2.1 \gamma_{w c}\left(Q_{n}\right)=2^{n-1}$ for all $n$.
Proof: $\mathrm{Q}_{\mathrm{n}}$ is a connected graph. For $\mathrm{n}=1, \mathrm{Q}_{1}=\mathrm{K}_{2}$ and $\gamma_{\mathrm{wc}}\left(\mathrm{Q}_{1}\right)=1=2^{1-1}$.
For $\mathrm{n}=2, \mathrm{Q}_{2}=\mathrm{C}_{4}$ and $\gamma_{\mathrm{wc}}\left(\mathrm{Q}_{2}\right)=2=2^{2-1}$.
For $\mathrm{n}=3, \gamma_{\mathrm{wc}}\left(\mathrm{Q}_{3}\right)=4=2^{3-1}$.
For $\mathrm{n}=4$ the structure of $\mathrm{Q}_{4}$ is given below.

We know that $\gamma\left(\mathrm{Q}_{3}\right)=2$. Either $\{3,5\}$ or $\{1,8\}$ can be chosen that is diametrically opposite vertices are chosen. Therefore their distance is three and hence $\gamma_{w c}\left(Q_{3}\right)=4$. Let $\gamma_{w c}\left(Q_{3}\right)$ set be $\{1$,
$3,4,5\}=\mathrm{A}$ (say). A dominates $\{9,11,12,13\}$. Therefore vertices to be dominated in Q4 are $\{10$, $14,15,16\}$.Minimum two vertices are required to dominate $\{10,14,15,16\}$. Therefore $\{1,3,4,5$, $14,16\}$ dominate $\mathrm{Q}_{4}$, but they do not form a weak convex dominating set since geodesic between $\{1,4\}$ require 6 and geodesic between $\{3,14\}$ require 8 . Thus minimum eight vertices are needed for a weak convex dominating set in $\mathrm{Q}_{4}$. These eight vertices can be chosen in any manner from the two layers of $Q_{3}$. Hence we observe that for $Q_{n}, 2^{n-1}$ vertices are required for a weak convex dominating set which can be got in any manner from the two layers of $Q^{n-1}$. Now we claim that $2^{n-1}$ is the minimum number of vertices for a weak convex dominating set in $Q_{n}$.

Let $k+1=2^{n-1}$ where $k$, lare the number of vertices chosen in two layers of $Q_{n-1}$ for a weak convex dominating set in $\mathrm{Q}_{\mathrm{n}}$.

Without loss of generality assume $1<k$. Let $\mathrm{Q}^{1}{ }_{\mathrm{n}-1}$ and $\mathrm{Q}^{2}{ }_{\mathrm{n}-1}$ denote the first and second layers of $\mathrm{Q}_{\mathrm{n}-1}$. Choose k vertices in $\mathrm{Q}^{1}$ in such a way that they form a weak convex dominating set in $\mathrm{Q}_{\mathrm{n}-1}$. Suppose we take $1-1$ vertices in $\mathrm{Q}_{\mathrm{n}-1}^{2}$. Now we claim that $\mathrm{k}+1-1$ vertices do not form a weak convex dominating set in $Q_{n}$.

## Case (i)

$1-1$ vertices are private neighbors of $k$ vertices. Consider $Q^{2}{ }_{n-1}$. kvertices are dominated by $k$ vertices of $\mathrm{Q}^{1}{ }_{\mathrm{n}-1}$. Rest of $2^{\mathrm{n}-1}-\mathrm{k}$ vertices in $\mathrm{Q}^{2}{ }_{\mathrm{n}-1}$ must be dominated. Choose $1-1$ vertices among vertices of $Q^{2}-1$ so that weak convexity is maintained among $1-1$ vertices. Suppose there are $m$ vertices from $k$ vertices in $Q^{1}$ n-1 that are for domination in $Q^{1}{ }_{n-1}$ then these $m$ vertices have private neighbors in $\mathrm{Q}^{1}{ }_{\mathrm{n}-1}$ itself. So private neighbors of these m vertices in $\mathrm{Q}^{2}{ }_{\mathrm{n}-1}$ must be chosen so that domination is not violated in $\mathrm{Q}^{2}{ }_{\mathrm{n}-1}$.

Thus $m+x=1-1$. Now $k-(1-1)$ private neighbors in $Q_{n-1}^{2}$ of $k$ vertices are not chosen. Since $1<\mathrm{k}$ and we choose $1-1$ vertices, there are atleast two vertices in $\mathrm{k}-(1-1)$.

Let $k-(1-1)=2$. Let these vertices be $u$, $v$. Let private neighbors of $u$ and $v$ be $u_{1}$ and $v_{1}$ respectively in $Q^{1}{ }_{n-1} . u_{1}, v_{1}$ are among $k$ vertices. Since $u$, vare not among $1-1$ vertices of $Q^{2}{ }_{n-1}$, $\mathrm{u}_{1}, \mathrm{v}_{1}$ do not contribute for domination in $\mathrm{Q}_{\mathrm{n}-1}^{1}$. Suppose $\mathrm{u}_{2}, \mathrm{v}_{2}$ are adjacent to both $\mathrm{u}_{1}$ and $\mathrm{v}_{1}$ then Suppose private neighbors of $u$ and $v$ form an edge in $Q^{1}{ }_{n-1}$. Then single vertex that dominates $u$ and $v$ is either $u$ or $v$. Therefore weak convexity is violated between $u(v)$ and a vertex among $k$ vertices which is adjacent to private neighbors of $u(v)$ in $Q^{1}{ }_{n-1}$. Thus a contradiction.

If private neighbors of $u$ and $v$ do not form an edge in $Q^{1}{ }_{n-1}$ and $N(u) \cap N(v) \neq \varphi$ then weak convexity is violated in $\mathrm{Q}^{2}$, which is a contradiction.

If private neighbors of $u$ and $v$ do not form an edge in $Q^{1}{ }_{n-1}$ and $N(u) \cap N(v)=\varphi$ then either $u$ or $v$ is required for domination in $\mathrm{Q}^{2}{ }_{\mathrm{n}-1}$. Thus weak convexity is violated between $\mathrm{u}(\mathrm{v})$ and a vertex among $k$ vertices which is adjacent to private neighbors of $u(v)$ in $Q^{1}{ }_{n-1}$. Thus a contradiction.

Therefore, $\mathrm{k}-(1-1)<2$. Hence minimum one vertex must be included in any one of the layers of $Q_{n-1}$ for a weak convex dominating set in $Q_{n}$.

## Case (ii)

None of $1-1$ vertices are private neighbors of $k$ vertices. Clearly weak convexity is violated between any vertex of $\mathrm{Q}^{1}{ }_{\mathrm{n}-1}$ and $\mathrm{Q}^{2}{ }_{\mathrm{n}-1}$.

## Case (iii)

Some of $1-1$ vertices are private neighbors of $k$ vertices. By Case (i) we get the result. Interchanging k and l we get the result for $\mathrm{k}<1$.

## Conclusion

In this paper we determined weak convex domination number for hypercube graphs. We also determined convex, weak convex, $m$ - convex and $l_{1}$-convex numbers of star and hypercube graphs. Other domination parameters for hypercubes are under study in our group.
